

Residential VoIP Phone Service

How it Works

Voice Over IP or VoIP is the next generation of your basic phone service. It works like your old phone service but is dynamically different. VoIP give you the flexibility of voice delivered over your high-speed internet connection. No longer are you at the mercy of the Local phone company and there expensive service. When you pick up the phone to make a call you hear a dial tone and make your connection like you always have. What's new is that you don't pay a kings ransom for telephone service.

What is VoIP?

VoIP, stands for Voice over Internet Protocol. It is a digital technology that enables you to use the Internet to send and receive telephone calls. Your voice is digitized and sent in packets through your high-speed Internet connection rather than by traditional phone lines. VoIP is less expensive and can include telephone long distance with your service. Your high speed-speed Internet connection can handle multiple phone lines giving you and your family the flexibility you've always wanted at a price that makes sense.

What does my old service have that Voip can't offer.

Nothing! You can call local phone numbers, mobile phones, long distance, or international numbers like you always have. And if you have long distance included in your package you can save a bundle. International calling is a snap and we can save you as much as 50% over your current rates.

What if I need to call 911?

VoIP includes 911 service allowing you to connect to 911 just like a traditional phone. If you need emergency service, help is only 3 numbers away.*

Why Voip?

Take charge of your voice service with:

- Digital quality connectivity
- Unlimited local and long distance to USA and Canada with most plans*
- You can use your existing phone or purchase a new state of the art Voip phone
